

Wheels: Nancy of Franklin writes, “I hope you have some suggestions where to look for a long-standing, highly annoying noise and vibration in the front of my 2000 Jimmy. It sounds like the driver’s side front wheel is going to fall off and the vibration can be felt in the steering wheel, the seat, and on the floor. Is this a safety concern? Is there some TSB out there about this problem? Please Help!”

Halderman: It would help if I knew if the truck was four-wheel drive or two-wheel drive, but regardless, the most likely cause is a tire problem. Have the tires been rotated? If not, then this may solve the problem or at least cause the problem to move to the rear. I checked and there are no technical service bulletins (TSBs) regarding this concern.
