

Wheels: An e-mail from Norm says, “My wife has a new Vibe and we like it real well except for the cruise control. It surely was a design flaw of some kind. Every time the speed drops below 25 mph, you have to reset the cruise. The dealer tells me this is the way it was designed but that is hard for me to believe.”

Halderman: Most cruise control systems do not function below 30 mph. If you set the cruise at 30 or 35 mph, it should hold that speed. Most people do not want to use the cruise control during city low speed driving. I do not think it is a design flaw and that it is simply working as designed.
