FIGURE 4-3 A vacuum modulator moves the modulator valve depending on the vacuum of the engine. A heavy load on the engine causes the vacuum to be lower than when the engine is operating under a light load. The spool valve applies mainline pressure to the boost sleeve of the pressure regulator valve, which causes the mainline pressure to increase.

FIGURE 4-4 (a) As the speed increases, governor pressure increases and is applied to the 1-2 shift valve. (b) When the 1-2 shift valve moves, the fluid is directed to 2nd clutch and the shift is completed.

FIGURE 4-5 (a) When a clutch applies, fluid pressure rises gradually until the circuit is filled and the piston strokes to take up the clearance; then there is a rapid increase to line pressure. (b) An accumulator can be placed into the circuit to slow this pressure rise and soften clutch application.
