PEARSON

FIGURE 1-1 In diesel engine downward movement of piston draws air into cylinder through intake valve on intake stroke. On compression stroke, air is compressed by upward movement of piston with both valves closed. Fuel is injected and ignition occurs at beginning of power stroke, and combustion drives the piston downward to produce power. On exhaust stroke, upward-moving piston forces burned gases out open exhaust valve.

QUESTION 1: ?

Which engine stroke brings in air?

PEARSON

ANSWER 1:

Intake.

Is torque ft-lb or lb-ft?

FREQUENTLY ASKED QUESTION

Definition of torque is a force (lb) applied to an object times the distance from that object (ft). Therefore, based on the definition of the term, torque should be:

- lb-ft (a force times a distance)
- Newton-meter (N-m) (force times distance)

However, torque is commonly labeled, even on some torque wrenches, as ft-lb.

PEARSON

Summary (2 of 2)

- There are three distinct phases or parts to the combustion in a diesel engine:
 - Ignition delay
 - Rapid combustion
 - Controlled combustion
- The term power means the rate of doing work. Power equals work divided by time. Work is achieved when a certain amount of mass (weight) is moved a certain distance by a force.
