	<p><b><u>DISCUSSION:</u></b> Discuss the pros and cons of using an OAP or OAD pulley. Why isn't an OAP or OAD being used on every vehicle?</p> <p><b><u>EXPLAIN TECH TIP:</u></b> <i>Alternator Horsepower and Engine Operation:</i> Many technicians are asked how much power certain accessories require. 100-ampere alternator requires about 2 horsepower from engine. One horsepower is equal to 746 watts. Watts are calculated by multiplying amperes X volts. Power in watts = 100 A X 14.5 V = 1,450 W  1 hp = 746 W, So, 1,450 watts is 2 horsepower. Allowing about 20% for mechanical and electrical losses adds another 0.4 horsepower. Therefore, when someone asks how much power it takes to produce 100 amperes from an alternator, the answer is 2.4 horsepower. Many alternators delay electrical load to prevent engine from stumbling when a heavy electrical load is applied. The voltage regulator or vehicle computer is capable of gradually increasing the output of the alternator over a period of several minutes. Even though 2 horsepower does not sound like much, a sudden demand for 2 horsepower from an idling engine can cause the engine to run rough or stall. The difference in part numbers of various alternators is often an indication of the time interval over which the load is applied. Therefore, using wrong replacement alternator could cause engine to stall!</p> <p>6. SLIDE 6 <b><u>EXPLAIN</u></b> FIGURE 19-5 An overrunning alternator damper (OAD) is not a simple one-way clutch or a solid pulley, but instead is engineered to dampen noises and vibrations in the front accessory drive belt system.</p> <p><b><u>DISCUSS FREQUENTLY ASKED QUESTION:</u></b>  <i>Can I Install an OAP or an OAD to My Alternator?</i> Usually, no. An alternator needs to be equipped with the proper shaft to allow the installation of an OAP or OAD. This also means that a conventional pulley often cannot be used to replace a defective overrunning</p>
