

Automotive Wiring And Wire Repair

Chapter 44

<http://jameshalderman.com>

ACROSS

- 1 _____ are used to protect wiring from a direct short-to-ground.
- 6 Terminals are retained in connector by the use of a _____.
- 7 _____ circuit protectors are solid state.
- 8 A _____ is a metal fastener attached to the end of a wire, which makes the electrical connection.
- 11 A _____ is a type of fuse that consists of a short length of standard copper-strand wire covered with a special nonflammable insulation.
- 13 _____ should be used in

every circuit to protect the wiring from overheating and damage caused by excessive current flow as a result of a short circuit or other malfunction.

- 14 The term _____ usually refers to the plastic portion that snaps or connects together, thereby making the mechanical connection.
- 15 _____ are uninsulated.
- 16 _____ are the largest wires used in the automotive electrical system.

DOWN

- 1 Most automotive wire, except for spark plug

wire, is often called _____ because it is designated to operate at or near battery voltage.

- 2 Most manufacturers indicate on the wiring diagrams the _____ sizes measured in square millimeters of cross-sectional area.
- 3 Wiring is sized and purchased according to gauge size as assigned by the _____ system.
- 4 _____ are mechanical units made of two different metals that deform when heated and open a set of contact points that work in the same manner as

an "off" switch.

- 5 The _____ is the term used to describe how high-frequency AC electricity flows through a conductor.
- 9 A _____ is used to transmit low-voltage signals using two wires that are twisted together.
- 10 _____ are 4 to 2/0 gauge electrical cables with large clamps attached and are used to connect a vehicle that has a discharged battery to a vehicle that has a good battery.
- 12 _____ or fuse links are used to protect wiring from direct short to ground. Also known as Pacific fuse elements.
