

Name \_\_\_\_\_

**SHORT ANSWER. Write the word or phrase that best completes each statement or answers the question.**

1) What are two advantages of gasoline direct injection compared with port fuel-injection?

---

---

2) What are the basic modes of operation of a GDI system?

---

---

3) What are two disadvantages of gasoline direct injection compared with port fuel injection?

---

---

4) What should be replaced anytime it is removed from the high pressure GDI fuel system?

---

---

5) How is the fuel delivery system different from a port fuel injection system?

---

---

## Answer Key

Testname: SHORT 81

1) Advantages include:

- Improved fuel economy due to reduced pumping losses and heat loss
- Allows a higher compression ratio for higher engine efficiency
- Allows the use of lower octane gasoline
- The volumetric efficiency is higher
- Less need for extra fuel for acceleration
- Improved cold starting and throttle response
- Allows the use of greater percentage of EGR to reduce exhaust emissions
- Up to 25% improvement in fuel economy
- 12% to 15% reduction in exhaust emissions

Page Ref: 946-947

2) The basic modes of operation include:

- Stratified mode
- Homogeneous mode

Page Ref: 949

3) Disadvantages include:

- Higher cost
- More components
- Need for NOX storage catalyst in some applications

Page Ref: 947

4) If any high-pressure line is removed, it must be replaced with a new part. Always replace the Teflon seal whenever replacing or reinstalling an GDI injector.

Page Ref: 951

5) A vehicle equipped with gasoline direct injection uses a fuel pump in the fuel tank similar to a conventional port injection system. Then, the fuel is sent to a high-pressure pump driven by the camshaft to the fuel rail. The computer controls fuel pressure using an electric pressure-control valve.
